

Choose from several roof panel and glass options!

Fully engineered roof panels

- All roof panels are tested using ASTM E72-98 procedures by an independent testing laboratory
- Our roof panels are constructed with a high density foam core bonded to maintenance free aluminum "skins." Core thicknesses range from 3" to 6" to meet your insulation and structural requirements. Roof panels are also offered in a high strength, phenolic resin impregnated, honeycomb-shaped core.

High performance roof panels

High Quality Glass

- Quality controlled seal on insulated units
- Manufacturer's warranty against seal failure and glass breakage
- Tempered glass is about four times stronger than annealed glass, with great resistance to thermally induced stress
- Choose single pane, insulated, Low E, argon filled, clear or tinted glass

Choose matching panel knee wall under your windows

(If broken, tempered glass falls into small pebble-like pieces, greatly reducing the likelihood of injury on impact.)

Add light and height with glass knee wall and transoms
